### **DETAILED ACTION**

1. This is in response to the amendments filed April 21, 2011. Claims 2, 3, 7, 16, 21 and 26 have been cancelled. Claims 1, 4-6, 8-15, 17-20 and 22-25 are pending and have been considered below.

### ***Response to Arguments***

2. Applicant's arguments, see remarks pages 2-4, with respect to the non-statutory obvious-type double patenting as being unpatentable over claims 1-141 of co-pending U.S. Application 10/963,427/US Patent 7,921,300. the rejecting has been withdrawn in view of the filing of a terminal disclaimer.

### ***Allowance***

3. Claims 1, 4-6, 8-15, 17-20 and 22-25 are allowed.
4. Claims 2-3, 7, 16, 21 and 26 have been cancelled.

### ***Examiner's Statement of Reasons for Allowance***

The following is an examiner's statement of reasons for allowance

5. Kessler et al (US 7,240,203) is drawn to a method and apparatus for processing security operations are described. In one embodiment, a processor includes a number of execution units to process a number of requests for security operations. The number of execution units is to output the results of the number of requests to a number of output data structures associated with the number of requests within a remote memory based on pointers stored in the number of

Art Unit: 2436

requests. The number of execution units can output the results in an order that is different from the order of the requests in a request queue. The processor also includes a request unit coupled to the number of execution units.

6. Verbauwhede (US 2003/0202658) is drawn toward an advanced encryption system (AES) architecture includes a maximum parallel encryption module which implements one round of the AES algorithm in one clock cycle, and a maximum parallel key scheduling module which generates sub-keys in one clock cycle in parallel with the encryption module, thereby permitting feedback modes of operation to be used without adversely affecting AES throughput. A controller controls the operation of the encryption and key scheduling modules such that one round is completed per clock cycle. The controller is preferably part of a hierarchical distributed control scheme comprising communicating finite state machines (FSMs).

7. Wichman et al (US 5,884,062) is drawn toward a floating-point unit which is arranged in pipelined fashion, and permits out-of-order execution of instructions in the event that an instruction generates an exception, such as an underflow condition.

8. *The above prior art reference of record do not teach or render obvious the limitations as recited in independent claims 1, 17 and 22 as presented.*

*The combined references fail to teach a cryptography unit, configured execute a plurality of cryptographic rounds on each of a plurality of input text blocks to generate a corresponding each of a plurality of output text blocks, wherein said plurality of cryptographic rounds are prescribed by a control word that is provided to said cryptography unit, wherein said cryptography unit executes a first plurality of micro instructions generated by translation of said single, atomic cryptographic instruction; and an x86 integer unit, an x86 floating point unit, an*

Art Unit: 2436

*x86 MMX unit, and an x86 SSE unit, wherein said cryptography unit operates in parallel with said x86 integer unit, said x86 floating point unit, said x86 MMX unit, and said x86 SSE unit, to accomplish said encryption operation, wherein said x86 integer unit executes a second plurality of micro instructions generated by said translation to test a bit in a flags register, to update text pointer registers, and to process interrupts during execution of said plurality of cryptographic rounds.*

9. Dependent claims are allowed as they depend from an allowable independent claim.

### ***Conclusion***

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
